

# Skin Repellent

20% Icaridin, spray 100 ml

Ed. 2010  
HRE020E

Diseases transmitted by insect bites such as dengue (Aedes), malaria (Anopheles), chikungunya (Aedes), West Nile virus (Culex) can be avoided with icaridin, the most effective skin repellents recommended by health experts.

## Product

### Description

With 20% of hydroxyethyl isobutyl piperidine carboxylate, this long-lasting skin protection repels mosquitoes and helps you avoid bites and the diseases they may carry, especially malaria, carried by anopheles.

The World Health Organization and the US Centers for Disease Control have recognized icaridin as the one of the three most effective skin repellents. Moreover, this skin repellent is almost colorless and odorless, and it has been reported as having less negative effects than DEET.

In addition to mosquitoes, it repels:

- midges,
- horseflies
- sandflies,
- biting flies, ticks, fleas, chiggers and other biting insects

Icaridin repels insects and makes them less likely to bite. It seems to block mosquitoes from sensing their prey. It doesn't kill insects.

### Instructions for use

Spray in an even coat on skin, being careful not to cause dripping with excessive amounts of product.

Use in conjunction with permethrin-treated clothing for maximum protection.

Apply more frequently in humid climates where perspiration can wash off repellent.

In such a climate, 100ml will last approximately 2 weeks (3 weeks in drier climates).

Reapply every 6 hours.
